Introduction

This report will review different ... ...

1.1 Background

Norway is among .....

1.2 Problem Formulation

Would a ....

Problems to be addressed

- Design ..
- Develop ...

1.3 Literature Survey

This report is based on .... published in 2016.

1.4 Objectives

The Objectives for this report thesis are:

1. Make ...
2. Implement ...
3. Create ...

1.5 Scope

In this particular project .....

1.6 Structure

1.6.1 Voxelization systems overview

The diagram in figure 1.1 shows how the diffrent software repositories regarding voxelization interconnects. The green boxes represents the main software projects. The blue box represents side projects. During development, some components were generalized and extracted into a separate repository.

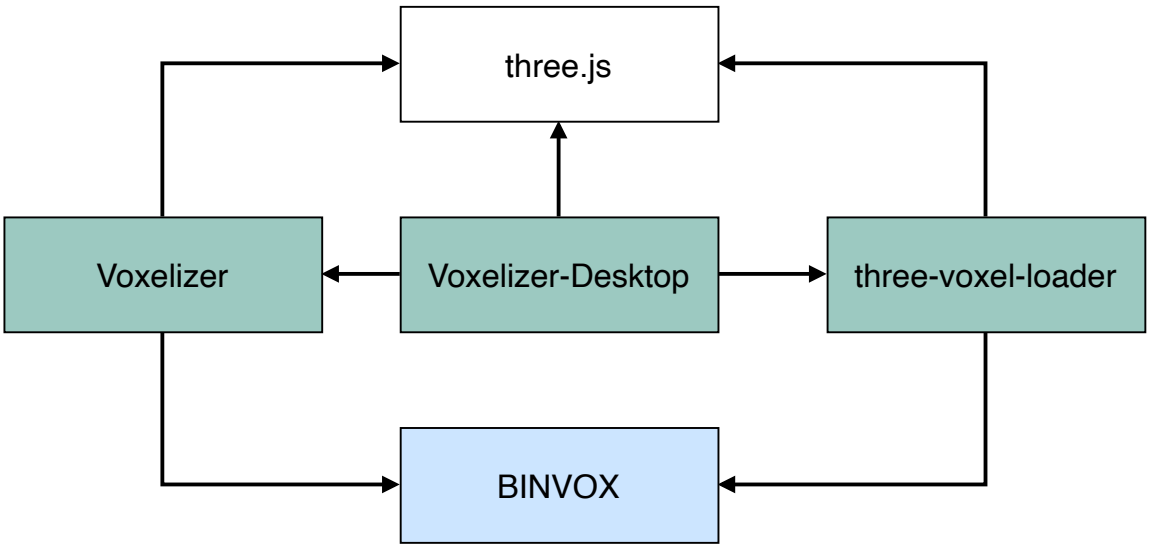

Figure 1.1: Automation of release publishing process.

1.6.2 Automation overview

Include diagram of simple github automation prosess?

1.7 Outline

The rest of the report is structured as follows.

Chapter 2 - Theory: Chapter two gives an introduction to the theoretical background ....

Chapter 3 - Method: Contains a description of the methodology and materials that were considered throughout the project ....

Chapter 4 - Result: Contains a description of the finished software systems

Chapter 5 - Discussion: Discusses the achieved results, the execution of methodologies and tools, in addition to encountered difficulties.

Chapter 6 - Conclusions: This chapter presents an overall conclusion of the project, reviewing the objectives and the progress made.

Chapter 2

Theoretical basis

2.1 Agile methods

2.1.1 Scrum

Scrum is an agile methodology. Background and history of the evolution of scrum..... What is it? How does it work?

2.1.2 Kanban

2.2 Open source

Short description of what it is.. Why it is good? Community engagement...

2.2.1 Licenses

Do i need this?

2.3 Git

Git is a type of version control system. It was created by .... and is today the most popular VCS.

2.3.1 GitFlow

GitFlow is a popular branching model for Git, created by Driessen, 2010. Figure 2.1 displays an example git history, adhering the GitFlow branching style.

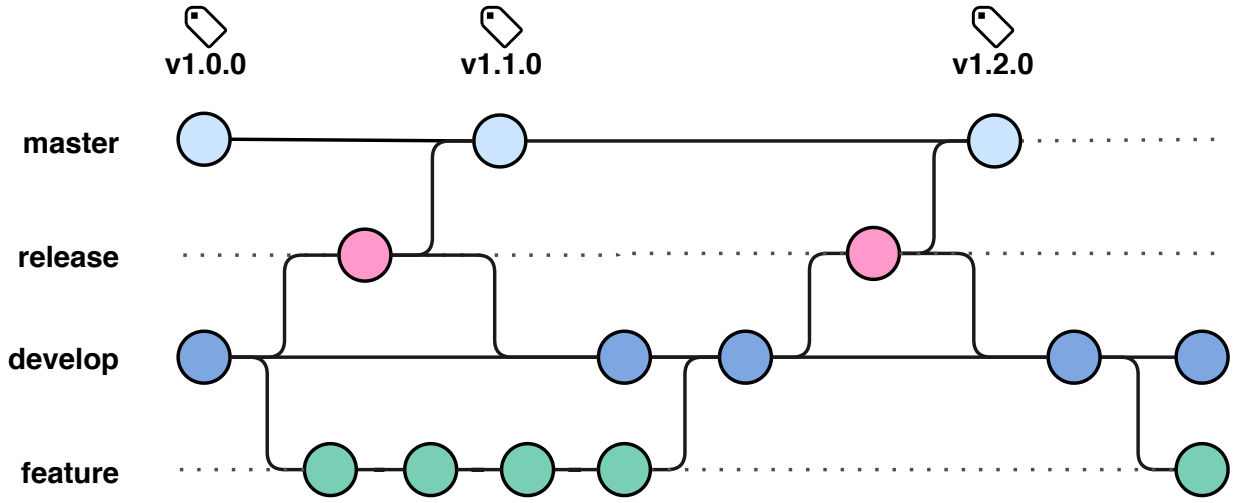

Figure 2.1: GitFlow branching model example.

2.4 GitHub

GitHub is primarily a hosting service for Git repositories. However, GitHub also provides a lot of other functionality through it's web-based GUI. They also provide automation (CI/CD), named GitHub Actions, Wikis, Access Controls, Task management tools etc...

2.4.1 GitHub Actions

Need to elaborate here as it is a main part of the thesis....

2.4.2 GitHub Pages

Short description....

2.5 HyperText Markup Language (HTML)

Short about HTML5

2.6 Cascading Style Sheets (CSS)

Short about CSS

2.7 JavaScript

JavaScript - actually named ECMAScript....

some history? => Short about Node.js... more in a later section.. a server side implementation of the JavaScript engine... Also mention Electron...

2.7.1 Interpreter

What does it mean that JS is an interpreter? What is it?

2.7.2 ECMAScript versions

2.7.3 Module systems

ES6 (ES2015)

CommonJS

Universal Module Definition (UMD)

Asynchronous module definition (AMD)

2.7.4 Package managers

Various Package registries, like NPM and GitHub Package Registry.

npm

(I use this one) –> More info

Bower

Asd...

2.7.5 Transpilation

Asd...

Babel

Asd...

2.7.6 Bundling

JavaScript bundling is an optimization technique to combine separate resource files into one file. This is done in order to reduce the number of HTTP requests required for a page to load. In addition to the performance gain, bundling is also often done in order to develop a JavaScript application in separate files, also called modules. ..... ES6 modules, CommonJS etc...

Webpack

Asd...

Rollup

Asd...

Browserify

Short section?

2.8 TypeScript

TypeScript is a typed superset of JavaScript that compiles to plain JavaScript. It is open source, and primarily developed and maintained by[1].

2.9 Node.js

Short about Node.js... a server side implementation of the JavaScript engine...

2.9.1 Node package manager (NPM)

2.10 Electron

Short about Node.js... a server side implementation of the JavaScript engine...

2.11 React

2.11.1 JavaScript XML (JSX)

2.12 JSDoc

Markup language for annotating JavaScript source code files. JSDoc companion documentation generator: JSDoc3 - see git repo....

2.13 Data structures

Plural names ok?

2.13.1 Multidimentional arrays

Reference ndarray by Mikola Lysenko Also discuss Strided Arrays (in JS?).

[1] Microsoft, 2020.

2.13.2 Octrees

2.13.3 Bounding volume hierarchy

A bounding volume hierarchy, abbreviated BVH, is a type of tree structure.

2.14 Computer graphics

Faces, vertexes.... What is 3D models built up by? (polygons) triangles... color... texture maps Rendered by shaders (pipeline)

2.14.1 Ray casting

The raycasting is demonstrated in figure 2.2. A ray is directed towards an object. If it intersects a face

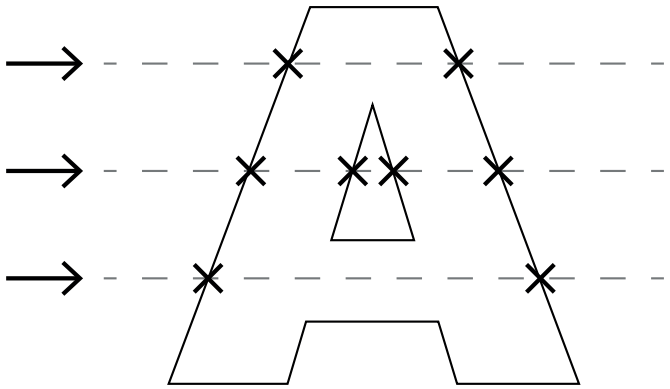

Figure 2.2: Raycasting intersections example.

2.14.2 OpenGL

2.14.3 WebGL

Uses OpenGl ES, a subset of OpenGL. ...

2.14.4 three.js

three.js abstracts away a lot of the manual handling of constructing vertices, faces, setup of WebGL ....

2.15 3D Modeling

Describe the process and fundamentals of 3D modeling. UV mapping Procedural generated texture.. Texture baking Use Blender etc...

Chapter 3

Materials and methods

3.1 Project Organization

Do i need this? The group consists of ... Meetings ....

3.2 Tools and libraries

3.2.1 JavaScript

3.2.2 Babel

- Babel - ES6 needs to be transpiled to ES5 (Browser compatibility).

3.2.3 npm

Needed packages.. Published all packages to npm.. Most stabile compared to GitHubs new repo....

3.2.4 Third party libraries

Why did i use them??? list up like: - xxx because ... - xxx provides ... Elaborate some on three.js - why is it good? (popularity)

3.2.5 GitHub Actions

Why? How did i use it? - For automation... - deeply integrated in GitHub.

3.3 Working methodology

3.3.1 Scrum

Even though this is a one man project, i have tried to adapt the scrum methodology. ...

3.3.2 Requirements specification

Acceptance criteria

Acceptance criteria - custom field in Jira. Specially for the voxelization algorithm?

3.3.3 GitFlow

Why did i follow gitflow? Any changes to the usage?? Good for enforcing standards, automation etc..

3.3.4 Semantic versioning

All published modules are enforcing Semantic versioning. This ....

3.4 three-voxel-loader

3.4.1 Loading data

Used Three.js internal "Loader" -> Factory pattern -> Octree - XML - VOX - BINVOX -> Separate repo! - 3D array

3.4.2 Visualization

Traverse the octree -> Level Of Detail support -> BufferGeometry (Many cubes) Merged BufferGeometry => Better performance -> only one draw call.

3.4.3 Debugging

Developed an example -> later polished so you can find it on github...

3.5 Voxelizer

Short intro

3.5.1 implementation

UML diagram of system here

3.5.2 Voxelization

Currently, the only voxelization algorithm that is implemented is mainly based on raycasting.

SKIP?: Alternatively to raycasting, one could make use of color picking. This is in principle significantly qu

The raycasting is supplied by three.js library. The library provides a thoughourly tested and accurate raycasting solution. However, it itterates every face.. O(n).. Not good... The implementation of a three.js plugin were therefore used. it uses BVH to speed up the raycasting from O(n) to O(log n).

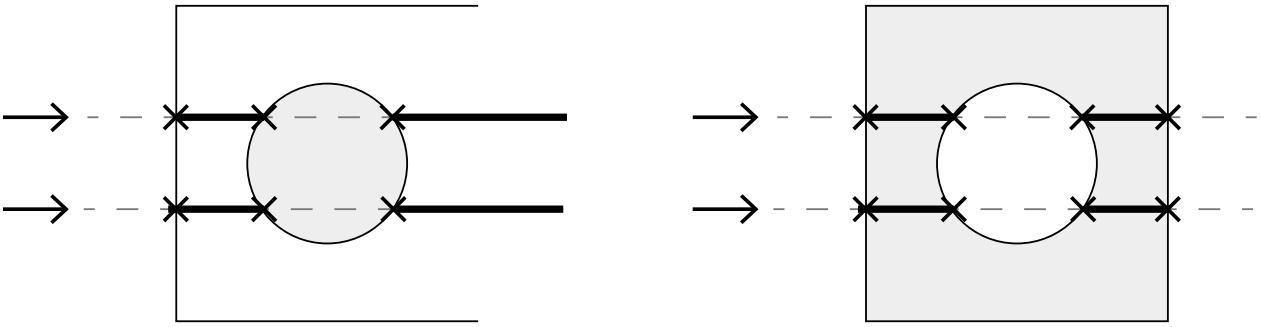
Shell voxelization

Asd

Solid voxelization

Maybe more discussion or result related? The solid voxelisation, or filled voxelisation, is achieved by interpreting the first raycast intersect as the surface of the object. From this point will ev-

erything be considered "inside" the object. When a second intersect is detected, the state is changed to be "outside" the object. A new hit would indicate "inside", and so on. This works verry well with a watertight (edges are manifolded?) 3D model, as can be seen from figure 3.1a. However, when trying to fill an object which is not watertight, this can result in severe inaccuracies. This can be seen in figure 3.1b



(a) Non-watertight 3D model cross section.

(b) Watertight 3D model cross section.

Figure 3.1: Solid (voxelization) filling of 3D model cross section.

3.5.3 Color system

Reads object texture maps, extracts color etc...

3.5.4 Loading

The Voxelizer library/engine previously made use of a wrapper OBJ loader. This support has been dropped in favor of the ES6 JS modules provided by three.js.

3.5.5 Exporting

- XML - BINVOX (Separate repo) - 3D array

3.5.6 Debugging

Developed an example -> later polished so you can find it on github...

3.6 BINVOX

A separate repo for building and parsing binvox files were constructed during refactoring of the voxelizer and the three-voxel-loader plugin....

3.7 Voxelizer-Desktop

3.7.1 Electron

Auto updating

3.7.2 GUI

... Sketches?? Wireframe diagrams of GUI etc...

3.8 JSDoc Action

Implementation in JS, not docker. Gives best possible speed, and cross compatibility (Win, linux and macos) Can be used with any other action to upload to the desired service, for example GitHub pages.

Diagram of implementation here

3.8.1 JSDoc

Passes to cmd, loads configs, etc....

3.8.2 Templates

Support for templates. Downloads with the help of npm. Can be a github repository, npm package, etc...

3.9 Automation

3.9.1 Workflows

GitHub Actions... Figure 3.2 shows the continous integration and continous development pipelines. Describe how they work here....

Security analysis

LGTM

Documentation generation

JSDoc Action -> GitHub pages

3.9.2 Release automation

Publish package

See figure 3.3

GitHub Action version tagging

Auto major version tagging update See figure 3.4

3.9.3 Dependency updating

Automated by Dependabot (accuired by GitHub).

3.9.4 LaTeX generation

Include how i have setup automation between my latex projects in order to generate thesis?

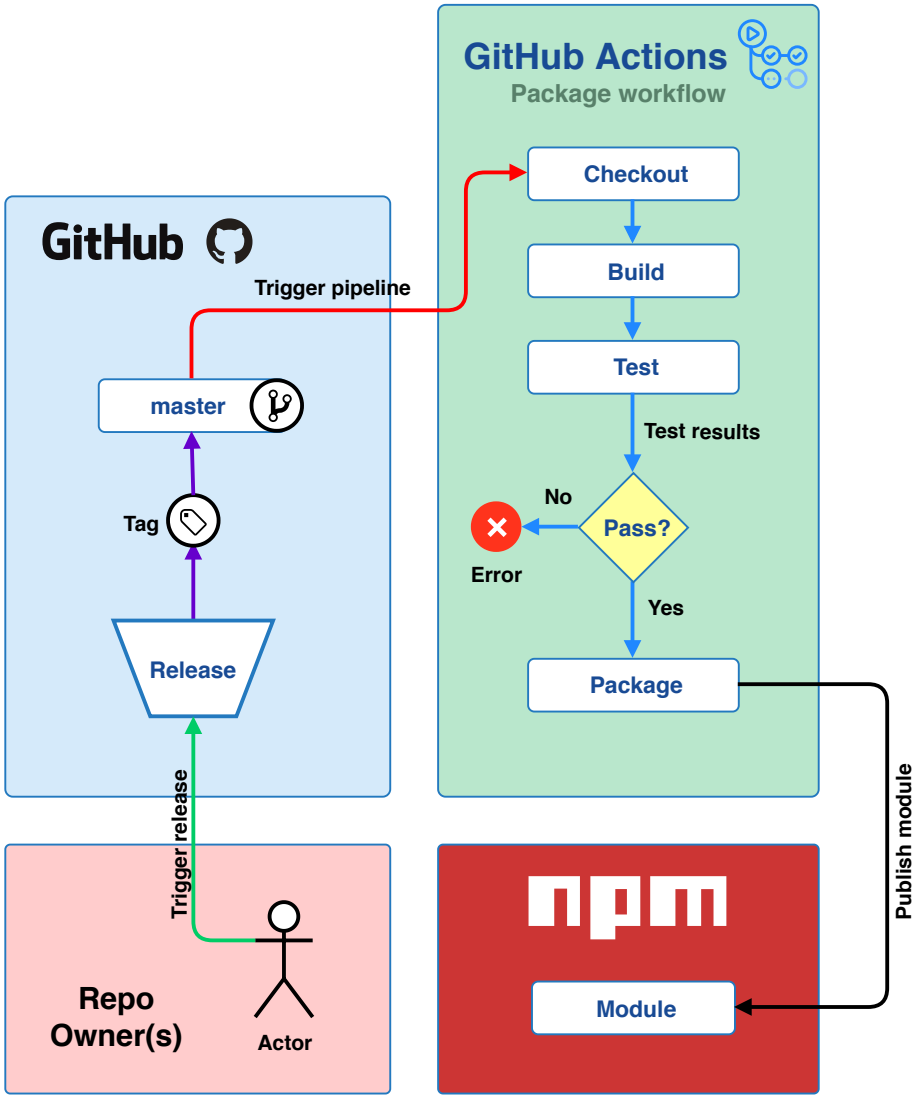

Figure 3.3: Automation of release publishing process.

3.10 file-existence-action

During development of the workflows, it became apparent that i needed to be able to check if a file existed, and use this result in the following steps of the workflow. This resulted in a relatively small GitHub action, named File Existence.

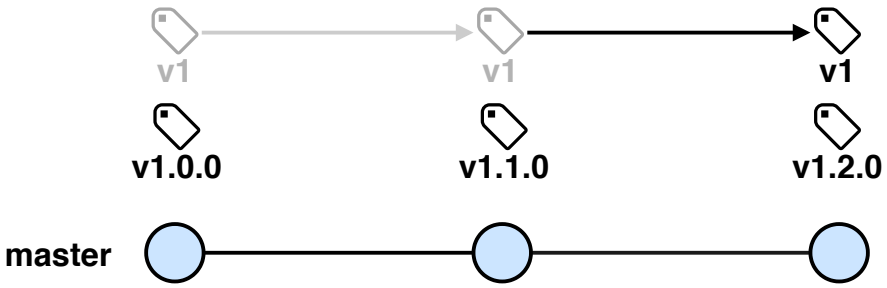

Figure 3.4: Automatic updating of major version tag.

3.11 file-reader-action

During development of the workflows, it became apparent that i needed to be able to read the contents of a file, in order to check if it was empty and in that case, terminate the workflow. this resulted in a very small GitHub action, named File Reader.

Chapter 4

Result

Brief assessment of the overall goals (or recap?) What to be discussed in this chapter... This section presents a walk through of the results...

4.1 three-voxel-loader

Include picture of voxelized chicken here

4.1.1 Level Of Detail

Include picture of torus with low LOD

4.1.2 Performance

Not optimized, a lot of unnecessary voxel geometry rendered when only outer mesh is visible.

4.1.3 Loading support

- XML - VOX - BINVOX -> Separate repo! - 3D array

4.1.4 Example

An example is available on GitHub pages (repo)

4.2 Voxelizer

General overview of the engine.... Completely redesigned.. Features: Extendible ...

4.2.1 Voxelization

side by side image of anvil and the anvil voxelized.

As you can see from the figure xxx, the system support coloring.....

4.2.2 Visual inspection

No holes, accurate representation Compare to requirement specification.

4.2.3 Performance

Do some tests and present them in a table. Compare to requirement specification acceptance criteria.

4.2.4 Importing

This will be left up to the user. Supports all three.js meshes....

4.2.5 Exporting

Several formats... - XML - BINVOX - 3D array - ndarray

4.2.6 Usage example

Example of how to use the library with code!!!! HERE!!!!

4.3 Voxelizer Desktop

TODO Cross compatibility Speed Simple to use Secure

4.4 JSDoc Action

Easy automation of JSDoc generation and publication. Included in MAIN JSDOC REPO!!! 10.000 stars and 38.000 users!!!

Supports templates and all that JSDoc3 natively supports. Can use other actions to deploy docs to arbitrary service.

4.5 Supportive projets

4.5.1 BINVOX

JS module Binary format... Parses BINVOX files into JSON. Builds BINVOX from JSON. Works according to the official specification Cross platform support (Node.js and Browser), ES6 and UMD.

4.5.2 file-existence-action

Simple GitHub action to check for the existence of files.

4.5.3 file-reader-action

Simple GitHub action to read the contents of a file.

4.6 Automation

More or less fully automated all build and release/publishing steps.

4.6.1 JavaScript modules

- Building - Testing - coverage upload to coveralls - Security analysis with LGTM - JavaScript documentation Generation and deployment of the docs to GH pages. - Publishing module to NPM.

4.6.2 GitHub Actions

- automation of "node-modules" installation setup - automatic update of major version tags according to guidelines recommended by GitHub.

4.6.3 LaTeX automation?

Should i include this?

4.7 Open-source community

Several of the projects has already gained interest by the public. Promotion og JSDoc Action in the main repo with 38 thousand users.

4.7.1 Statistics

Number of stars, weekly downloads, etc

4.7.2 Feedback

Several filed issues (which has been resolved). Feedback from the users, etc... Feature requests...

Chapter 5

Discussion

5.1 Completness compared to requirements specification

The system is overall considered a sucess. All primary objectives are completed and

5.2 Test results

5.2.1 Result 1

The ...

5.3 Future work

5.3.1 three-voxel-loader

Performance

The three-voxel-loader plugin generates a cube buffergeometry for every voxel. Even for voxels that are not visible from outside the model. When loading a large and filled voxel model, this results in an enourmous number of faces being rendered, putting a heavy load on the hardware. A future improvement could be to only render a shell geometry based on the voxel "cubes". This would dramatically reduce the number of triangles needed to render the voxel model.

Chapter 6

Conclusions

Summary

This preliminary report concerns the plans and preparations for a bachelor's thesis at the Norwegian University of Science and Technology (NTNU).

The purpose of the thesis is to improve and further develop the already existing open source project named Voxelizer. Voxelizer is a JavaScript library for converting 3D models into a volumetric representation, a process known as voxelization. The library needs to be refined, professionalized and extended.

To ease the use of the library, a cross platform desktop application and a command line interface will be developed. In order to make the Voxelizer library and the complementary software easy to maintain, the projects will have a focus on automation. Especially, a GitHub action will be developed for automating the generation of JavaScript documentation.

Contents

Chapter 1

Terminology

Concepts

Voxel Three-dimensional analogue of a pixel, representing a value on a regular grid in three-dimensional space.

Voxelization The process of converting a 3D model into voxels.

Library A collection of data and programming code that are used to develop software.

Cross-platform Computer software that can be run on multiple computing platforms.

Abbreviations

MDN Mozilla Developer Network

API Application Programming Interface

UML Unified Modeling Language

GUI Graphical User Interface

CLI Command Line Interface

Chapter 2

Introduction

This project aims to improving an already existing open source [27] library named Voxelizer [20]. It is a cross-platform library for conducting voxelization of 3D models, and is written in JavaScript.

The background for its creation was an assignment in a simulation course. The objective was to simulate diffusion using a cellular automaton. I wanted to do the simulation in the shape of a 3D object. Hence, I needed some way of constructing a volume representation out of a 3D model. Further, I also wanted to make the simulation with web technologies by making use of Three.js [21], an abstraction layer over WebGL [11].

To my surprise, I couldn't find any simple open source JavaScript solution for this. I therefore decided to make a solution myself. The result was the open source library "Voxelizer". However, due to time constraints, the current state of the library can only be considered a crude prototype. It has several issues, lacks important features and needs to be professionalized.

Alongside the library, a desktop program and a CLI interface will be developed. These will be making use of the Voxelizer library, and will greatly simplify the use of it.

Chapter 3

Project organization

3.1 Project group

Name of student
André Storhaug

3.2 Steering group

The steering group will consist of Ricardo Da Silva Torres at NTNU in Ålesund, along with Saleh Abdel-Afou Alaliya at NTNU in Ålesund. Torres will act as supervisor and Alaliyat will be the co-supervisor.

Chapter 4

Attitudes

As a computer engineer, one is expected to behave responsible and professional. One should be curious of new technology and strive to provide the best solutions possible. Further, one should take proud in ones own work and feel a certain responsibility of the work that is done.

In a world that is becoming increasingly smaller, good collaboration is essential. In the role as a computer engineer, it is expected that one will come into contact and collaborate with persons from many different disciplines. It is therefore vital to have open mindsets and welcome new ideas. Discussions are to be expected. However, disagreements should be kept factual and handled respectfully.

The development of software is often a large part of the job as a computer engineer. Software has potential to affect human lives. Either directly or indirectly. The creation of software should therefore be rooted in strong ethics and respect for the users privacy. With this in mind, open source is a great way of achieving both transparency and openness. Today, everything revolves around profit. Companies are doing everything from charging huge amounts for proprietary software, to profiting on your personal information. However, open source has become a popular platform in which people can collaborate on software projects. By join forces and helping one another, one can achieve truly great things.

Chapter 5

Project description

5.1 Thesis problem - goals - purpose

5.1.1 Thesis problem

There exists an open source JavaScript library for conducting voxelization of 3D models. This library is called "Voxelizer". However, the library faces several issues and is lacking important features. It needs to be professionalized and made easy to both use and maintain.

5.1.2 Goals

This project has two main goals. The first goal is to improve and extend the open source Voxelizer library in such a way that it fulfills the requirements specified in the next section. The second goal is to develop a cross platform desktop application and a CLI for easy voxelization of 3D models, based the Voxelizer library.

In order to ensure maintainability of the various software projects, automation is critical. Therefore, a common subgoal will be to develop a GitHub action in order to automate documentation generation.

5.1.3 Purpose

The purpose of this project is to make it easy to conduct high quality voxelization of 3D models.

5.2 Requirements specification

The scope of this project is defined and limited by the requirements specification defined in following sections. In addition to this specification below, a backlog with user stories shall be created.

5.2.1 Voxelizer

Algorithms

The voxelisation algorithm should provide an accurate render of the original 3D model (polygon mesh [25]). The result should be geometrically representative witout distortions. No holes should be presen, unless dictated so by the given 3D model shape. Internal cavities and structures needs to be accuratly preserved. Lastly, there should be an absolute minimum of artifacts.

It should be possible to do two types of voxelization. One that is a shell voxelization, and another that is a filled volume version. The shell-type algorithm should only capture the surface of the 3D model. The filled-type algorithm needs to capture a complete volume representation of the 3D model.

One should be able to set the wanted resolution of the voxelization.

Input

The library should support a large variety of different input types. Both in terms of various file types and data structures. Support for popular file formats such as OBJ, STL and gLTF should be implemented.

Output

A diverse mixture of output types have to be supported. This includes relevant file formats and data structures. Some file formats for saving voxel data are VOX by MagicaVoxel [6], XML, BINVOX [14] and minecraft SCHEMATIC format. Relevant data structure exports include 3D arrays and octrees.

It should also be possible to export the voxelized result as normal 3D models. This could be file formats such as OBJ, STL and gLTF. Each voxel in the model should be represented as a cube.

Lastly, one could also support image export for each layer of the voxelized result. File format could for example be JPEG or PNG.

Coloring

The texture of a 3D model should carry over to surface voxels. This should be in the form of the most representative color.

Optimization

tree.js raycasting should be optimized. three.js raycasting is CPU based. It itterates each face in a 3D model, checking if the ray intersects a face or not. However, one can speed up the raycasting by employing a spatial index, for example with the help of an octree [24] or aabb tree .

5.2.2 three.js voxel loader

The three.js voxel loader module needs to be able to load voxel data into a three.js mesh [23]. The module should manage to load the voxel file formats and data structures that the voxelizer library supports exporting. This is voxel data stored in the form of a 3D array or an octree, or in a file format like VOX, XML BINVOX or SCHEMATIC.

It should be possible to customize the appearance of the loaded voxels. Both in terms of size, material and/or color.

5.2.3 Voxelizer Desktop

The Voxelizer Desktop shall be a corss-plattform [26] desktop application. It should work on both MacOS, Windows and Linux. The application should be able to voxelize a 3D models with the use of the Voxelizer library [20]. Also, it should automatically update itself when a new release of the application is published.

The application should provide intuitive GUI. It should be possible to view both the original

3D model and the voxelized result. Also, it should be possible to generate a 2D view of the cross-sections of the voxelized model.

5.2.4 Voxelizer CLI

The Voxelizer CLI should be a corss-plattform [26] CLI application. It should function on both MacOS, Windows and Linux. The application should be able to voxelize a 3D models with the use of the Voxelizer library [20].

5.2.5 JSDoc Action

The JSDoc GitHub Action should be an installable GitHub Action [9], available from the GitHub marketplace [2]. It should automate the process of generating JavaScript documentation with the help of JSDoc [12].

5.2.6 Automation

Automation should be used to ease maintenance of the various software projects. Firstly, JavaScript projects needs to have the documentation automatically generated with JSDoc [12]. Secondly, the process of publishing new versions should be automated to the greatest extent.

5.3 Methodology

The method that will be utilize in this project is the agile methodology Scrum [19]. Scrum is a very popular working methodology in the software development business. It uses an iterative and incremental approach, where each sprint gives an opportunity to improve the development process. Scrum organizes the work in sprints. This is a predefined period of time that is devoted to a set of very defined goals. The tasks to be done are often defined in a product backlog [18].

Scrum is mainly intended for teams. However, even though this is a one man project. The Scrum methodology will serve as a project framework for keeping up with progress, in addition to being able to adapt the project pace to the available working capacity. By breaking down the

tasks to be done in sprints, this will help with organizing the work and steering the project in the right direction, allowing adjustmens along the way.

For this project, each sprint will be two weeks long. After each spring, a review of the completed sprint will be made. This will be an opportunity to reflect on the process, and see which goals were completed and which wasn't. Further, this review will be highly valuable for determining if adjustments should be made for the next sprint.

Scrum also seems to be a good fit because there will be a meeting with the supervisor every two weeks. By organizing the tasks to be done in two-week sprints, this will make the meetings with the supervisor more effective and relevant. New functionallity can be discussed and reviewed, in addition to planning ahead for the next two weeks.

5.4 Information gathering

The main source of information will come from various web resources. Everything from articles to code documentation will be needed for this project. The MDN Web Docs [15] will be an important source for JavaScript documentation. For Node.js related work, the Node.js API Docs [16] will be put to good use. Also, documentation from the third party library Three.js [22] will be essential. Further, Stack Overflow [17] will be a highly valued source of information due to its wast amount of questions and answers in a lot of topics.

5.5 Risk analysis

A qualitative approach will be used for assessing the risk of this project. A risk can be described as the likelihood of an event times the impact. A **MEDIUM** risk level will be accepted. The table 5.1 will be used in order to define the various risk levels.

Table 5.1: Risk level matrix.

		IMPACT			
		LOW	**MEDIUM**	**HIGH**	**VERY HIGH**
LIKELIHOOD	**VERY HIGH**	MEDIUM	HIGH	VERY HIGH	VERY HIGH
	HIGH	MEDIUM	HIGH	HIGH	VERY HIGH
	MEDIUM	LOW	MEDIUM	HIGH	HIGH
	LOW	LOW	LOW	MEDIUM	MEDIUM

In table 5.2 below, a risk assessment and risk control is conducted. The letter “L" stands for “Likelihood”, “I” for “Impact” and "R" for "Risk".

Table 5.2: Risk assessment table.

						Residual risk		
ID	**Description**	**L**	**I**	**R**	**Risk control**	**L**	**I**	**R**
R1	Services like GitHub, Jira and Confluence may go down, making various resources unavailable.	L	VH	H	Perform regular backups of important data.	L	M	M
R2	Sickness, resulting in inability to work.	M	M	M	Practicing good hygiene.	L	M	M
R3	Damaged equipment used for development.	L	VH	M	Exercise caution when handling important equipment.	L	H	M
R4	Lost or corrupt files due to system crash or failure.	M	VH	H	Perform regular backups of important data.	M	L	L
R5	Incompatibilities between technologies.	M	M	M	Properly assess the technology and plan ahead before starting development.	L	M	L
R6	Security vulnerability in package dependency.	VH	H	VH	Automatic package auditing and fixing provided by GitHub [10].	L	H	M

VH: VERY HIGH risk

H: HIGH risk

M: MEDIUM risk

L: LOW risk

The risk assessment done in table 5.2 shows that with the appropriate counter measures, all risks are reduced to a MEDIUM level. This is an acceptable level.

5.6 Primary activities in further work

Table 5.3: Main activities.

Nr	Main activity	Time/scope
A1	**Writing**	**18 weeks**
A11	Preliminary report	3 weeks
A12	Bachelor's thesis	15 weeks
A2	**voxelizer**	**7 weeks**
A21	Core improvements	1 week
A22	Algorithm improvements	2 weeks
A23	Texture support	1 week
A24	Extending 3D model file loading	1 week
A25	Extending data exporting	1 week
A26	Write tests	3 days
A27	Optimization	2 days
A3	**three-voxel-loader**	**2 weeks**
A4	**voxelizer-desktop**	**3 weeks**
A41	Core	1 week
A42	GUI	2 weeks
A5	**voxelizer-cli**	**1 week**
A6	**jsdoc-action**	**1 week**
A7	**Automation**	**1 week**

5.7 Progress plan

5.7.1 Master plan

Following is a gantt diagram 5.1 for the planned time sceduling. This includes all activities listed in section 5.6. These activities primarly include writing and software development. Activity A1 is concerned about writing the preliminary report and the thesis. Activity A2, A3, A4, A5 and A6 is concerned with the development of various software systems, where each activity is a confined project. A7 is concerned with automation of various tasks in many of the software projects.

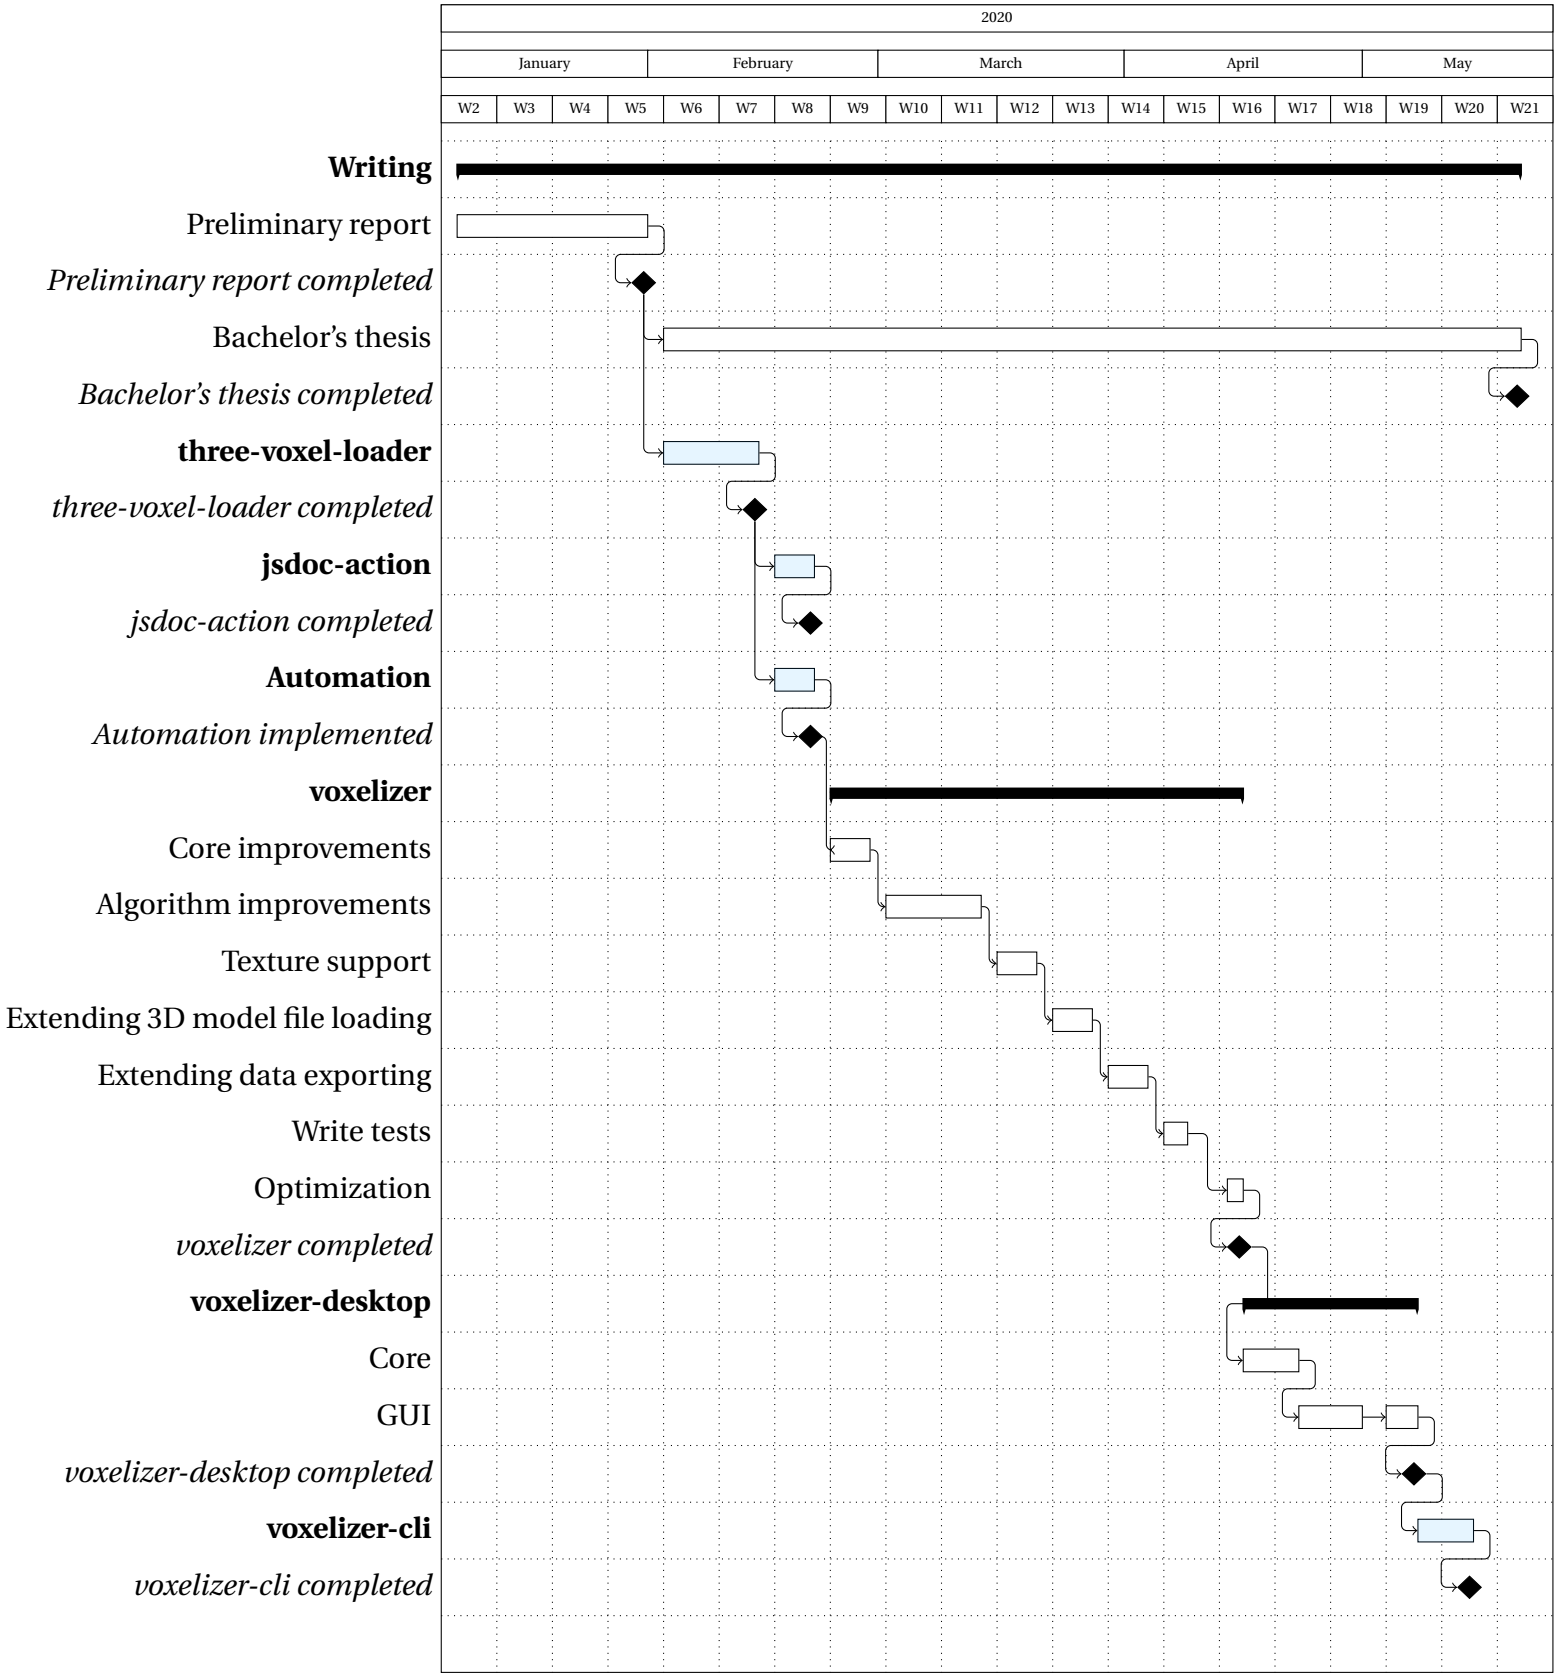

Figure 5.1: Gantt diagram of progress plan.

5.7.2 Project control assets

In order to keep the project on track, Jira [4] will be used. Jira is a project management tool developed by Atlassian, supporting a vast number of features such as issue tracking and project management. The main reason for choosing Jira over for example GitHub's solutions, is that Jira supports the agile methodology Scrum. For managing documents, minutes of meetings, UML diagrams, etc., Confluence [3] will be used.

Since this project revolves around open source projects, Jira and Confluence will only be used for internal related work. For public usage, the GitHub issue tracker and wiki will be used. Any issues, bugs or documentation of public interest shall be be placed on GitHub, instead of Jira and Confluence.

5.7.3 Development assets

For developing the various systems, the development tools listed in table 5.4 will be used.

Table 5.4: Development tools.

Development tool	**Description**
Visual Studio Code [13]	Editor for writing and debugging code.
Blender [7]	3D modeling software.
Git [8]	Version control.
GitHub [1]	Hosting of git repositories.
SourceTree [5]	Git desktop client.

5.7.4 Internal control and evaluation

At the end of each sprint, a review of the completed sprint will be conducted. A burndown chart will be generated for each sprint. This will help identifying if adjustments to the plan is nesseseary.

The requirements specification will serve as the primary criteria in order to decide wether a goal is completed or not. If a system is implemented but contains minor bugs, it will still be considered complete.

Chapter 6

Documentation

6.1 Reports and technical documents

Firstly, a progress report shall be created for every two weeks. Secondly, documentation for the various systems will be produced. In order to make a successful software library, good documentation is imperative. A lot of this documentation will mainly be automatically generated by JSDoc. The automation will be integrated in the workflow of a new version release of a system (GitHub repository). This ensures the validity of the documentation, as well as ensures future maintenance. This integration will be provided by a GitHub action, also to be a part of this project. The generated documentation will be publicly available, hosted at GitHub Pages. Lastly, various UML diagrams will be created. These will serve as illustration for the relationship between the various systems.

As mentioned in section 5.7.2, internal documentation will be kept private in Jira and Confluence. Documents of public interest will be placed publicaly available on GitHub.

Chapter 7

Planned meetings and reports

7.1 Meetings

A meeting with the advisor will be held every two weeks. These meetings will be used for reporting on the current progress. The meetings are an opportunity of gathering constructive feedback from the supervisor. Further, they will serve as documentation for working both professionally and responsible. A minutes of a meeting report will be written for every meeting.

7.2 Progress reports

Progress reports will be developed up-front of each meeting. These will describe what activities were planned, and what activities were actually seen through. If any deviations from the plan occurred during the period, these should also be included in the progress report. Further, the activities planned for the next period should also be outlined. The report will be sent to the supervisor at least a day before the meetings. This will form the basis for the matters to be discussed at the meetings.

Chapter 8

Planned deviation management

In the event of deviations from the current plans, both in terms of progress or content, several measures needs to be taken. If the deviations from the plan are of greater significance, the supervisor should be alerted. If the deviation is of lesser importance, it should be discussed with the supervisor at the regular meeting. One should then consider to change the planned approach.

Many of the planned systems builds upon one another. Therefore, if a task shows to be harder and more time consuming than first anticipated, it should consume time from tasks of lower priority. However, if a task exceeds its planned time scedule because of minor bugs, then these bugs should be properly documented and the task considered finished. These bugs should then be revisited at a later stage if there is time to spare. Since the systems are open source projects, these bugs might also be resolved by volunteers after this project is finished.
